

The Ins And Outs Of Rodent Control

Get The Facts:

- Some of the most common rodents you will find in your home are the **House Mouse** and the **Norway Rat**.
- These rodents are nocturnal, meaning most of their activity and feeding occurs at night- **daytime activity is a sign of a large infestation.**
- Rats and mice have **limited eyesight** and use their vibrissae (long whiskers) as guidance **along walls.**
- **Litters:** They can produce 4-8 litters a year, with 5-12 young per litter - **this means your resident rodent family can increase from 6 to 60 in 90 days!**
- **Diet:** These rodents are **omnivorous** (they will eat almost anything that is available).

Rodents in Your Home:

Your Attic: Mice are excellent climbers and may use your drain pipes and vents to get into your attic or gutters. Once they are in, they may chew on wires, gnaw on rafters, and destroy your insulation!

Your Walls: Rodents can easily climb between two surfaces and in small spaces, making walls an optimal way to move from your crawl to your attic.

Your Crawl: Rats and mice are opportunistic and will use your crawl space as a refuge and food source. They can ruin your foundation vents and crawl door, as well as leave disease-causing urine and feces scattered throughout.

Why Critter Control?

- Our **certified wildlife technicians assess** your home for signs of infestation and damage.
- We select the **right bait and optimum placement.**
 - **We are licensed** to use Conrac & Final Blox from Bell Laboratories, the world leader in rodent control technology, in tamper-resistant stations.
 - We know how important proper placement is in success: placing stations **20ft apart** along rodent runs (walls) works best.
- **Most importantly, we properly close and seal all entry points** to prevent new pests from sneaking in.
 - *Most companies only bait, leaving openings for rodents to move freely!*

How do they get in?

Rats can fit through an opening smaller than a quarter

Mice can fit through an opening smaller than a dime
