

Vole Control

What are voles?

- Voles, unlike moles, are **rodents**.
- They **look similar to mice** but have a shorter tail and smaller ears that sit close to the head.
- There are **2 types** of voles in the Triangle: **Pine Voles** and **Meadow Voles**.

Why Critter Control?

- Our **trained technicians** know how to **properly assess** your property to identify active burrow entrances (vole holes).
- **We are licensed** to use Bell Laboratory's PCQ Pellets that are designed to compete with natural food sources so voles choose to consume it.

Starting price at \$249* includes:

- Assessment
- Same day treatment
- Follow up treatment 2-4 weeks later

Have voles AND moles?

- Pricing starts at \$399 to treat both

Voles and Your Lawn:

- Both species of vole can cause **damage** to your plants and lawn.
- Voles are **herbivorous**, consuming the roots of your plants and even bark from young trees.
- Voles are active **year round**.
- Pine voles **live and travel underground** while meadow voles **spend most of their lives above ground**.
- The underground tunnels (or runs) are typically found **along house foundations, garden walls, and vegetation**.
- Voles are prolific breeders: a female vole can **produce 2-5 young every 2 months**.
 - Those young reach sexual maturity after 30 days and can produce another 2-5 pups each.
 - **That's a lot of voles that can quickly overwhelm your property!**

Let us help you reclaim control of your property!

*\$99 service fee due if treatment not completed
